--- Transcription ---

Claude just changed how we trade stocks forever, and it's because of this new skill that lets it access live market data, track what Wall Street, whales, and US politicians are buying, and use that to play the stock market with all that information automatically. I've actually been using this for the past couple of weeks, and it's completely changed how I think about trading. So, in this video, I'm gonna be breaking down how you can get started in three levels. So first, we're gonna get set up. I'll walk you through the basics of how trading works, and we'll get Claude and all the tech set up. Then, we're gonna be building a copy trading bot. I'm gonna be showing you how to track what Wall Street, whales, and US politicians are buying, and have Claude copy their exact moves automatically. And level three, we're gonna get into options. I'll break down what they are, how they work, and then we're gonna be building a bot that runs one of the most consistent income strategies in trading, called the wheel strategy. And even if you've never bought a single stock before or have zero technical background, you'll be able to do this, because all we're gonna be doing is simply speaking to Claude. Let's get into it. Okay, before we get into anything, I need to give you some context on why I'm actually making this video and why this matters. Because for the first few years of my career, I used to work at J.P. Morgan, and I actually got to see how institutional trading works up close. And the biggest thing I took away from that is the gap between Wall Street and regular people comes down to just three things. First, it's the data. So imagine like a poker game, and you're sitting at a table with your two cards trying to figure out what to do. But the person across from you can see every card on the table and every card in your hand. You'd probably never sit down at that table, right? And that's the stock market. That's what you're playing against every single day. Wall Street knows when a billionaire places a massive bet on a stock. They know when a senator buys shares right before a major announcement. They see where the money is moving before you even hear about it on the news. And by the time you do hear about it, they've already made their money. So you're stuck trading against people who have the information you don't have any access to. And unfortunately, that's the game. That's the kind of access that used to cost hundreds of thousands of dollars a year. But now I'll show you how to access that kind of information with a single click of a few buttons. Second is execution. Say you spot the perfect trade, but you're at lunch, or you hesitate for like 10 minutes and the window closes. Wall Street doesn't deal with that. They have systems watching the market and placing trades around the clock automatically. And luckily, Claude can do that too. Which brings us to number three, which is intelligence. Having the data and the speed really means nothing if you don't have a plan. The big guys have teams reading all that information and making calculated decisions. And to do all of that, you need to buy expensive tools. And if you couldn't afford the tools, you were locked out. But with Claude and these new skills, that barrier is gone. And I'm gonna show you how to set all of that up. All right, let's build this thing. I'm gonna be explaining everything as we go. So if you're brand new, just follow along. So if our goal is to get Claude to trade stocks for us, to do that, Claude needs two things. It needs somewhere to place the trades and it needs the information to decide what to trade. Let's start with the first one. And actually back in the day, if you wanted to buy a stock, you'd have to call a person on the phone and say something like, I don't know, buy me 50 shares of IBM. That person was to go to the stock exchange and make that happen

for you. That whole system, the firm, the person, the access to the exchange, that's called a brokerage. But today, it's an app. You open up Robinhood or Fidelity or tap a button and you own a stock. That's the same concept with just no phone call. But here's where it gets interesting for us. Some brokerages actually let you skip that step entirely and connect it through code. And because Claude is so good at coding, that's what we need. Because we're not gonna be the ones trading, Claude is. And we're gonna be using a tool today called Alpaca. It's free to sign up and it gives you API access, which is how we're gonna get Claude to connect to it and place trades on our behalf. So let me show you how to do that. Wait, but more importantly, before we get any further, quick disclaimer, I'm not a financial advisor. This is not financial advice. I'm just showing you how to build cool stuff with AI. And everything we're doing today is in paper trading. And paper trading means that you're using fake money in a real market. So it's the same stocks, the same prices, everything behaves the same way. You're just not risking a single dollar. Okay, so let's connect Claude to our brokerage. Okay, so to get started, what we're gonna need first is the Claude desktop app, all right? So I'm gonna do `claude.com slash download`. And if you need any of these links, it's gonna be in the link in the description below. If I'm going here, and you see, you just wanna download this app and you can use it for Windows or Mac, but make sure you download the Claude desktop app, okay? All right, so after you install the app, you'll get something that looks like this. Make sure your software or your Mac OS is up to date so you have everything available. And ideally you have the pro or the max version of Claude paid for, okay? So that's step number one. Step number two is we need to make our brokerage account. So I'm gonna go back into my browser and I'm gonna search up Alpaca. And you can see Alpaca trading platform. And I'm gonna go here and I'm gonna sign up. All right, so after you enter all your information and you go through, you're gonna see you have this dashboard right here. And in this dashboard, if I go to the top left and I open this up and you see, I have an individual trading account, but everything we're gonna be doing is not with real money, it's with paper money. So what we're gonna be using is this paper trading account, okay? And you can, you know, if you wanna make a new one, I'm gonna say trading Claude. And let's say we can give ourselves, I don't know, \$50,000. Okay? And save. And you can see right there, we're gonna have a trading Claude account and I'm gonna click this. So now I have \$50,000 to essentially play with in the stock market, all right? Now I'm gonna show you how to get this connected with Claude. To get this connected with Claude, what we're gonna do is I'm gonna scroll down right here and you see right here where it says API keys. What we wanna do is hit generate new API keys, okay? And you can see there's three things, endpoint, key, and secret. We're gonna need all three of these, all right? So let's get Claude set up. I'm gonna go back to my Claude app. And here, what I want you to do right now is hit this thing that says code, okay? It's the same thing, we're just gonna be talking to it, but all it is is a little bit of a different interface. Okay, so cool. You see this little guy here and that means we're good to go. And I'm gonna do is right here, I want you to hit this button right here and hit a new folder, okay? Because we wanna keep everything we're doing organized, I'm gonna go to documents and I'm gonna hit new folder and I'm gonna call it trading, okay? So now everything we do is gonna be saved into this trading folder, all right? Okay, I'm gonna move this to the side. Now, what I'm gonna do is I'm going to be pasting in right here this and then go back to Claude and then say endpoint. I'm going to say key, oops, Claude, key and then I'm gonna say copy this one and then go to Claude and then say secret, okay? Now, let's see if we can get our Claude

to trade a simple stock just to make sure our connection is solid. And after our connection is solid, we'll build layers on top of that so we can actually get it to do some really cool stuff, all right? All right, so what I'm gonna be telling it is this. Hey, what I want you to do, I just gave you the documentation and my keys to connect to my Alpaca trading account. I'm just testing the connection right now. Can you please buy one share of Apple? I want to see it inside my account, all right? Great, so all this is good. Right now, just to make it a little faster, I'm gonna right here, click Sonnet because this is a very easy command and I'm gonna hit go. All right, so it's saying the order is placed successfully. Here's the summary. Now, if I go back here and if I reload, okay, awesome. Great, so you see, I already bought a share of Apple. Now, you can trade by just talking to it. Hey, can you sell that share of Apple and then buy a share of Tesla? Great, Trust Workspace. And here, this is what I want you to do as well. Hey, can you make sure in this folder, you save these credentials so I don't have to keep giving it to you when we want to trade? We're gonna be using this account and in this folder, we're gonna be doing a lot of trades. Okay, so what we're gonna do is because right here, we gave it access to all this stuff, I wanna make sure I don't have to keep giving it access. I'm just getting it to save these credentials inside a file. Right now, Claude can trade, but it's trading blind. It doesn't know what to buy, when to buy or why. It's missing the most important piece, which is strategy. So let's get into that. In this level, we're gonna turn Claude into something that runs on its own. So basically a bot that watches the market, makes its own decisions and based on the rules you set. And the first strategy we're gonna make, you can think of it like a smart thermostat. Once you set the rules, if the room temperature, let's say drops below 68 degrees Fahrenheit, you're gonna turn on the heat. If it goes above 75 degrees Fahrenheit, you kick on the AC. That means you don't have to sit there, fiddling with your phones, messing with the temperature all day. The thermostat does that all for you. It checks, it acts and adjusts. And the bot is gonna work exactly the same way. That means we're gonna be setting some rules and let me show you how this works by actually explaining the trailing stop strategy, which is a really good strategy used by many different traders. Let me show you how the trailing stop strategy actually works. So say you buy a stock at \$100. Well, let's say we tell Claude, if this drops to \$95, sell it. That's your floor. \$5 is the most you're willing to risk on this trade. Now, if the stock starts climbing up and let's say hits 110, if it didn't go down, but your floor is still sitting at that 95, then you're exposed to a \$15 fall. That makes no sense. So what we want is Claude to move up our floor to 105, which means if the stock dips and hits the new floor, you're still up \$5 in profit and you were protected the entire time. But what if the stock drops right out the gate, right? Well, that means it would just hit \$95 and you'd sell it and you're out \$5 and that's your loss. Now here's the important part. You're not stuck. You've still got that capital. Claude can now take that money and goes looking for the next setup. Maybe it's the same stock a week later at a better price. Maybe it's a completely different opportunity. The point is you lost a small portion that you're okay to lose and risk. Basically you live to trade another day. And ideally we find trades like this. So let's say the stock keeps climbing and every time it does, Claude is gonna drag the floor higher and higher. You can never fall back to where you started. It's basically now going to sell at 110. So you get that \$10 in profit, which is a 10% gain. That's a trailing stop. You set the rules once and Claude follows them every second of the day. You're always protected and you're always locking in the gains. So when a trade doesn't work out, you move on fast with the most amount of money still in your pocket. Now, why am I telling you all of this? Because the worst

thing you can really do is hand your AI a pile of money and be like, go figure it out. The rules aren't the limitation. That's the whole point. This is how you take what you know, your instincts, your risk tolerance, your read on the market and you encode it. The same rules are true here. Claude can execute thousands of decisions faster than any human. It's executing your decisions, just running at the speed and discipline that you never could on your own. That's what makes this different from just letting AI loose. And I'll show you how to set this all up in the next portion. And to set this up, it's actually really simple. So I'm just back in my chat where I have been speaking with my Claude and I'm just gonna be speaking to it. And just to make it a little easier, if you guys wanted this, in my classroom, if you guys are already watching this, if you go to skills, you'll see I have a bunch of skills here. So this is the prompt we're essentially going to be speaking to our Claude. So let me just go to Claude and right now, don't worry about it. If you want those docs, it's there, but you can follow along with me in this video. So I'm just gonna speak it to it. All right, so I want your help to actually schedule a trailing stop strategy on let's say Tesla, right? I want you to buy Tesla using Alpaca paper trading account by, I don't know, like 10 shares at the market price right now and set up these rules. The floor, if the stock drops, let's say by 10%, sell everything. That's my stop loss. I don't wanna lose more than that on this trade. The trailing floor, if the stock goes up 10% from what I paid, move my stop loss up. Maybe move it up 5% below the current price. Every time it climbs, move another 5% up the floor again. So the floor only goes up, never down and then I want you to also ladder in. If the stock drops, let's say by over 20, 30%, buy a bunch more shares, let's say 10 more shares. If it drops by, let's say 20%, buy 20 shares. This way I'm getting better prices on the way down instead of just losing money. And after you set this up, show me a summary of every order and right after you place it so I can confirm this looks right. Okay, so I word vomited some stuff there and let this finish and I'll show you what this looks like. So I see you just got done and it says this is the current price. And if I go back to my Alpaca dashboard, I can see it set some price, it bought some Tesla and then it even set a stop loss right here. Now, one more thing we need to do is make sure we go back here and be like, hey, can you set up during market hours every day that you're checking consistently when we need to move our floor up or need to make new stop losses or re-enter. Use the slash schedule to make sure we have that going and set your own schedules. So this just executed one trade. Now, what I want is clock to basically be alive and keep looping and checking on a schedule like, hey, are these trades looking right? Do I need to re-enter? Do I need to move my floor up? All of that stuff. Normally we would have to do it, but right now with the command I just gave it, it should be able to do it on its own. Okay, so it just got done and it says literally Tesla trailing stop monitor and it's gonna be doing that every five minutes from Monday to Friday, 9 a.m. and it's gonna keep checking. And just so you're clear, on the left-hand side, if you hit, see this clock, if you hit this clock, it says scheduled and if you open it up, these local tasks are already going to be running right here. You can see it already set the schedule for me. I didn't have to touch this and if my computer is on, it's going to be running this on its own. Now we have basically made a trading bot. Now let's go through a couple different scenarios. Hey, so just briefly and really quickly, can you tell me what would happen if let's say Tesla shoots up to \$500 randomly? What would you do? And right now I'm role-playing it just so you understand and I encourage you to do this as well so you understand what would happen in different scenarios and what would it actually do? And if you do really need to change its thinking and thought processes around, you could just be like, hey, change

this around, okay? And right here, it just done, it says if Tesla shoots to 500 on the way up, the trailing stops kick in, trailing activates, your floor moves up, up, up, et cetera. And that's about it. Yeah, this is a really cool way to do ladder buys. Those don't trigger at all. You see, right now I don't have any of them. So I'm going to be like, can you think about what are good ladder buys and make sure you set that up in the schedule and update the strategy inside our whole strategy of what we're trading right now? So as the price goes up, it buys in gradually. So we're always at somewhat of a profit and we're pretty safe in our buys. And just so you see, it even gave me the ladder levels of if it's negative 15%, it's going to buy 10. If it's 50%, it's going to buy 50. You can always change this around, but this was really cool. Now that me, without me having to do any of this stuff, Claude can just action it for me. Now this is all great, but the thing is we're still paying attention but the thing is we're still picking stocks ourselves. We choose Tesla because we like it, but that's a gut feeling. The biggest traders and the best traders in the world don't trade on gut feelings. They trade on information. So in the next level, we're going to be showing Claude where the smart money is so Claude can actually make informed decisions. But what is smart money? Well, on wall street, there are people who move millions of dollars in a single trade. When someone puts, let's say \$50 million into a stock, they didn't really just do that of a gut feeling or flipping a coin. They have a lot of research teams and a lot of private data. They know something. These people are called whales. And when these whales make a big move, it leaves a trail like massive options orders, unusual volumes on a stock out of nowhere. And a group that does this a lot is surprisingly US politicians. But the nice part is that the members of Congress are required by law to report their stock trades. The data shows is that many of them consistently beat the market. They sit on committees, they regulate entire industries, they get briefed on policy changes before the public even hears about them. They know which companies are about to get a government contract and which ones may get investigated, but you can't see what they bought and follow them. And most people have no idea this data exists, but it's there and Claude can read it. But the thing is, we can't just tell Claude to go scour the internet for these hedge funds trades and congressional filings and all that. There's millions of data points hitting the market every single day. No AI can really browse its way through all of that, but there are services that do this full time. These companies are scraping and organizing all this data around the clock. And the data is sitting there waiting to be tracked and updated every day. And what we need to do is plug Claude into that. And that's what this new skill and MCP does. Think of it like a power outlet. The electricity, the insider information is running through those walls. And we basically plug our Claude into that so we can use it. These services have data flowing through their systems and the MCP is the plug that connects Claude to their data. And once it's plugged in, Claude can pull from it anytime. It becomes a new skill and Claude goes from being smart, but working with nothing to being smart and seeing what the big players in the market see. Next, what we're gonna do is give our Claude the power to access these services and it's gonna be super easy. So let's get into that. And just to emphasize why I'm so excited about this strategy I'm about to show you, this is me just backdating. Let's say a year ago, you were copying the same thing and the same strategy by copying the smart money. You can see if you were following the S&P 500, you were just buying and holding it, you would have made around, starting at a 50K account, you would have made around 57,750, which is around 15%. So you would have made 15% more money. But if you copied McCall, then you would have made 67,400 by the end of the year, which is a 34.8%

return. You can see how these politicians have access to this insider information and they can out-compete everybody. And that's what I'm gonna show you how to do. And just to make sure our strategies are organized, what I'm gonna do is go to another paper trading account. So right here, I'm gonna use this Simon account and I'm gonna do the same thing, okay? So I'm gonna hit generate keys. I'm gonna take all of the stuff or I can just copy and paste this. And then I can go back to my cloud. And then what I'm gonna do now is make a new session. So I'm gonna hit new session and I'm gonna paste this in. And now what I'm gonna do is the service we're gonna use to track these politicians. If you go to Google, I'm gonna do capital trades and capital trades is a free service that you can be using to see which politician is trading what and what's going on. So I'm gonna copy this URL. I'm gonna go back to my cloud and go right here. Okay, so now, by the way, the prompts are gonna be in the description below, but right now, hey, so I'm trying to set up a copy trading bot. When I've also given you access to my Alpaca account, I want you to make a new folder inside this folder so we can have this running and have these schedules done. But what I want you to do is number one, find a politician who has been having really good success in the stock market currently and is actively trading. And then what I want you to do is copy their trades, okay? So set up your cron jobs and your schedules. So you're always looking and using capital trades to see what they're up to and copy those trades. Make sure you buy, sell, buy the same options that they knew, whatever you need to just copy them. And then we're gonna be tracking that over time, all right? And you're gonna be using the Alpaca account that I just posted the image of. Great, I'm gonna hit bypass permissions, enter bypass mode, and then hit enter. All right, that was super easy. Let me wait for this to finish and we can see what's going on. Okay, so it just got done and I see in my schedule, it's already set a schedule to see what these politicians are doing. And then I actually also asked it, who are you copy trading and why? And it chose Michael Macau. All right, very interesting. And why is basically, okay. And why the algorithm picked him over the others? Because it seems like he's very active right now and he's the top trader, interesting. The trades may be slightly stale, but that's the nature of how they disclose. We still get a lot of gains because mostly Congress can buy like two years out or something like that. So they don't do data trading and they're not allowed to do it. That's why even if we're a little late because we know about it later, we can still make those gains. And just to reiterate, you can see this is a simulation for the year. If we started one year ago and did this exact same thing, if we copied this exact same strategy, this bot would have made an extra \$9,650 in comparison to the S&P which would have only made around \$7,000. So that's a 2.2X return over the S&P 500. And that's how these guys just stay so rich. It's kind of crazy. So with that out of the way, now I'm gonna show you the third strategy, which is a strategy that really advanced people use, which means you can get paid no matter which direction the stock moves. And to understand that, I'm gonna explain how options work. Okay, so what is an option? Well, an option is basically a contract when two people agree to do a deal. And let me show you this with something you already may know. Okay, so let's say you pay your car insurance company \$100 a month. In exchange, you get the right to file a claim if something goes wrong. And if you crash, the insurance covers it, you're protected. And if nothing happens, they keep your 100 bucks. They're basically getting paid to take on the risk. Now, look at this exact same structure. What happens is you pay a premium to another trader where you get the right to buy or sell a stock at a locked price, okay? And if the stock moves your way, you can exercise that contract and profit. If the stock doesn't move your way, the

contract will expire. They keep your premium. It's the same deal. You basically paid for protection. They got paid for the risk. And here it is next to each other, row by row. It's identical. The premium, the right to act, the expiration date. And if nothing happens, the other side keeps your money. That's all an option is, insurance on a stock, okay? And to dive in, there are only two types of options. A call option gives you the right to buy a stock at a locked in price. Say Apple is at \$200. You can buy a call option with a strike price of 210. That means if Apple goes to let's say 230 before your contract expires, you can buy it at 210 and pocket that \$20 difference. If Apple stays below 210, your contract expires and you lose the premium you paid. That's your max loss. Think of it like putting a deposit on an apartment. You'll pay \$500 to lock in the rent for \$2,000 for 30 days. If the rent price jumps to \$2,500, you got a deal. If they don't, you lost that \$500 deposit. And on the other side is a put option. The put option gives you the right to sell a stock at a locked in price. Say you own Apple at \$200. You buy a put option with a strike price of 190. If Apple drops to 170, you can sell it at 190 instead of 170. The put basically protected you from the drop. That's the insurance side. You paid a premium to protect yourself against the price drop. Why this is interesting is because with stocks and options, you can actually flip the table and become the insurance as well. So that is called selling options. So when you sell an option, you basically become the insurance company. You're the one that's collecting the premiums. So someone pays you for a contract. And most of the time, that contract expires without anything happening and you keep the money. And the cool part is the insurance companies make billions doing this. They collect premiums after premiums from millions of people and pay out on a small percentage of claims. The math basically works in their favor over time. And selling options basically work the same way where you collect a premium upfront. And if the stock doesn't hit the strike price by the expiration, your contract dies and you keep everything you were paid. And the wheel strategy is built on selling options. You are the insurance company. You collect premiums at every stage. And let me show you how that works. Okay, so let's walk through the wheel strategy with a real example with let's say Tesla. So Tesla is trading at \$250. And let's say you really like the stock, but you're not paying 250 for it. You'd rather get it at let's say 230. So if you sell a put at the 230 strike and for making that promise for saying I'll buy Tesla at 230 if the price drops there, someone is gonna hand you \$5 per share. That's \$500 in your pocket right now just for agreeing to do a deal you already wanted. Now, two things can happen. Tesla can stay above 230, which means the contract might expire. Nobody makes you buy anything and you get to keep the \$500 and you can do it again the next week. The other scenario is Tesla drops below 230 and you have to buy it. But remember, you collected \$500 before already. So your real cost isn't 230, it's 225. You got Tesla cheaper than anyone else and you wanted it anyways. Okay, so stage two, let's say Tesla does drop and you get assigned, which means you have to buy the Tesla shares. Now you own 100 shares at an effective cost of 225. Most people would be upset, but you're not because you set the price. You got paid to wait and you bought it at a discount, right? That's not a loss, that's your plan working. Now it's time for stage number two. Okay, now that we own the shares and they're sitting in our account, what we're gonna do is we're gonna sell a covered call, which means we will pick a 260 strike price. That means someone is gonna pay us another \$5 per share, which is another \$500 for the right to buy your Tesla shares for 260. If Tesla stays below 260, that contract expires, you keep the shares and you keep the \$500. And you can sell that call again the next week. And this is cool because you're generating income from a stock that

isn't even moving. Because if Tesla does go above 260, your shares get sold, but look at the math. So let's say you bought the Tesla shares at 225. You sold it at 260. That's a \$35 per share in stock gains. Plus the \$5 you collected selling that put, plus the \$5 you collected selling the call. That's \$45 per share in total profit on 100 shares. That's \$4,500. And here's the best part. Once your shares get called away, you go right back to stage one. You sell another put, collect another premium, and the wheel just keeps spinning. Every single rotation, you get paid. The stock can go up, down, sideways, it doesn't matter. You're collecting income at every stage. The wheel strategy sounds great until you try to run it for yourself. You're picking strike prices based on your market conditions and all these other things every single week. Most people who learn about this wheel give up after a few weeks because management is what buries them. And the cool part about Claude and what I'm about to show you is that Claude handles all of it, which means Claude itself can monitor the positions, pick expirations, and roll contracts when needed, which means you just collect the premiums on a schedule and you'll check in, let's say, once a day. So with that out of the way, understanding why Claude makes this so effective, let's set one up. Okay, so for this, we're gonna be using the first trading Claude account, and I'm gonna go back to Claude, and you see I actually have a prompt right here that you can copy-paste, and just so you can follow along, I'll read it out to you, okay? So what this is is basically, I want you to run a wheel strategy on, let me see, Tesla, using my Alpaca trading account. Stage one, you sell the puts, so you sell a cash-secured put on Tesla with a strike price around 10% below the current price. Pick an expiration two to four weeks out, collect the premiums. If the put expires worthless, sell another one and keep collecting premiums. If I get assigned, I have to buy the stock, move to stage two. Stage two is selling the calls. Once I own the shares, sell covered calls with a strike price around 10% above what I paid. Pick an expiration, maybe two to four weeks out, collect the premium. If the call expires worthless, sell another. Keep collecting premiums. If my shares get called away, like sold, go back to stage one and start again. And the rules are never sell a put unless I have enough cash to buy the shares if assigned, and never sell a call before the premium expires. So I'm going to go back to stage one, and I'm going to go below my cost basis, what I actually paid, and track my premium across all cycles and check my positions every 15 minutes during market hours. Please set the schedule. If a contract hits 50% profit before expiration, close it early and give me a daily summary at market's close, all right? Run this during market hours, do nothing outside market hours. Great. And now I'm going to hit enter and wait. But that's about it. You're going to see after this is done, I'll show you in a bit, it's going to set the things in a schedule. It's going to keep running this. And I encourage you to maybe set up a paper trading account and then have a go at it, see how it will do. These are just some fun strategies that I've been playing with that I think have been pretty useful and super revolutionary of what we can really do with Claude. But if you're watching this and you can see the power of Claude, but haven't used it before, or you tried it, but you're not sure how to get the most out of it, I'm actually putting together a full course that's going to walk through everything from scratch, how to set up Claude, how to use it, how to build projects like this one step-by-step. So stay subscribed for that. And in the meantime, watch this video. If you want to see me going deeper of any of these strategies or build something else together, join my Claude club, where we can do this and we'll have some fun.
